DIGESTIVE MOTILITY DISEASES

(Gastroparesis, Pseudo-Obstruction, Colonic Inertia)

**disable millions of women, men, and children
across North America.**

**My government
has not done enough to
support medical research!**

**Medical research for my digestive disease has
been grossly under funded.**

**Sufferers have the worst quality of life and the
least number of treatment options
compared to other digestive diseases.**

**Digestive Motility Diseases disable and cause death.
We need hope, we need answers,
we need treatments!**

**I am your mother, your daughter, your father, your son.
Put a focus on my disease. I am here. My suffering
is very real. I need to be seen!**

Movement, and the breakdown of food by your digestive system is called digestive "Motility." When it falters, symptoms are bothersome to severe. Gastroparesis is the most common of the Digestive Motility Diseases.

Digestive Motility Diseases are severe neuro-muscular disorders of the digestive tract that lead to a weakened or paralyzed digestive system. For the severely affected, symptoms lead to hospitalization from spiraling malnourishment and dehydration from non-stop nausea, vomiting and abdominal pain. Feeding tubes may be needed to sustain life.

About 3 million people in North America have severe Gastroparesis and cost taxpayers billions of dollars. So few treatments for such a serious digestive disease--this is a medical crisis and human tragedy!
